

A Guide to the
Marine Stations
of the
**North Atlantic and
European Waters**

PART 1
NORTHERN EUROPE AND THE EAST ATLANTIC COAST

compiled on behalf of
The Royal Society's Naples Zoological Station Committee
by J. E. Webb

The intention of this guide is to help scientists select marine stations with facilities for their research.

Prospective visitors want to know about the types of shore in the neighbourhood, the animals and plants of special interest that can be collected easily and also the range of boats, laboratories and equipment that would be made available for their use. In addition, as many visitors to marine laboratories combine research with a vacation, information on living accommodation at the Station or nearby for themselves and their families is helpful.

The information has been given in a reply to a questionnaire by the staff at each station. This method ensures some uniformity of presentation while photographic reproduction of the edited questionnaires means that revision when needed will not be difficult. The guide was not meant to be comprehensive, but was intended to include only those stations that want to have visitors. We have written to all stations known to us. Not all have replied and some may have been overlooked, but it is hoped that such omissions can be rectified in the first revision.

(Extract from Preface.)
